

New &
IMPROVED!

Electrical Safety featuring the
revolutionary new technology . . .

exclusively from Oberon

Electrical Safety | 16

 **OBERON**[®]

www.oberonsafety.com

Oberon has done it again!!

The REVOLUTIONARY new technology in Arc Flash protection is here!!

Oberon is excited to announce the release of its full line of True Color Grey (TCG) Arc Flash protective products. From the 8 and 12 calorie arc flash faceshield . . . up to the incredible 100 calorie arc flash suit. Now with this new patent pending technology.

Back in the mid 1990s, Oberon developed arc flash faceshields and hoods that incorporated the Green-IR materials into our line. Remember, this is before the NFPA 70E-2000 standard, the standard that ushered in this era of PPE for utility, industry and contractor electrical workers. At the time, the Green-IR technology was a radical idea, allowing the worker's PPE to protect against the radiant energy of an arc flash explosion. Unfortunately, this technology possessed a green tint, distorting the workers view of his task. Wire colors were distorted. Whites became green. Reds became black. Yet, it was the best technology available at the time. Work practices had to be altered to address this issue.

I would hear over and over again when traveling in the field, "Why can't you make an Arc Flash hood with a clearer window and the suits lighter and easier to wear??"

Well, with the development of the InovexFR fabric system over 10 years ago, we have dramatically addressed the weight of the suits that the users must wear. The ARC100 suit (100+ calories), for example, is over 50% lighter than an FR Treated Cotton garment providing comparable protection.

Creating a clearer window has been a challenge for our R&D team for years. We had great confidence in their talents since there is no company in this industry that knows plastic materials better than our R&D team.

Success came in 2015!!

The new TCG Series provides far better color definition than the previous Green-IR technology. See page 4 for additional information on the exciting capabilities of this technology.

This is a technology that is **EXCLUSIVELY** available from Oberon.

The advances of this technology will be obvious to you and your team. I would encourage you to witness for yourself the benefits of this **REVOLUTIONARY** technology.

Be safe!!

FEATURES of the TCG Faceshield & Hood Windows

Improved Color Definition/ Color Acuity

The TCG Series faceshields and hood windows feature a proprietary formulation of Polycarbonate that has a light grey tint. Like a pair of sunglasses, grey is a NEUTRAL color so you see equally all the colors. There is no distortion of the colors. Reds are red!! Blues are Blue!!

VLT (Visible Light Transmission)

The VLT is the brightness of what you see. Quite different from the color definition. The TCG Series faceshields and hood windows feature excellent VLT. In addition to seeing your colors well, the light tint allows you to see your work brightly and clearly.

Light Weight & Comfort

Most employees working on electricity do not walk around all day wearing their arc shield. Put it on . . . do the job . . . take it off!! The light weight design of the TCG Series makes it comfortable and easy to wear!! The hoods feature the Hood Ventilation System. No one wants to wear their PPE a moment longer than they have to . . . flipped up or on!!!!

How well do
you see the
colors of your
work??

 **MADE IN USA**

FAQ: Rubber Insulating Gloves

What protection do Rubber Insulating Gloves Provide?

Rubber Insulating Gloves are designed and constructed to act as a barrier between the user and the energy/voltage, to insulate the user from electric shock. The ASTM D120 standard outlines the protection that the glove provides. The rubber gloves are thicker as their protection increases. The rubber gloves will provide protection against either Alternating Current (AC) as well as Direct Current (DC), up to the levels detailed in the standard as well as typically on the labeling, which is required to be affixed to each glove. It is important NOT to exceed the USE voltage detailed to avoid injury.

Rubber Glove Class	Maximum Use Volts AC	Maximum Use Volts DC
	TASK UP TO 500 VAC	TASK UP TO 750 VDC
	TASK UP TO 1000 VAC	TASK UP TO 1500 VDC
	TASK UP TO 7500 VAC	TASK UP TO 11250 VDC
	TASK UP TO 17000 VAC	TASK UP TO 25500 VDC
	TASK UP TO 26500 VAC	TASK UP TO 39750 VDC
	TASK UP TO 36000 VAC	TASK UP TO 54000 VDC

How do I inspect my gloves?

Every pair of gloves must be inspected prior to **EVERY USE**. This inspection will evaluate the glove for any degradation or damage. A visual inspection will include looking for damage such as surface cracking, abrasions or punctures that may diminish the gloves' protection. Additionally, it is important to conduct an inflation test to determine if the glove have been punctured by prior use. This can be accomplished by grasping the glove at the cuff and spinning them, trapping some air within the gloves. Squeeze the glove and carefully listen and feel for escaping air through the glove. If you feel or hear escaping air, the gloves should not be used. Glove inflating devices are also available.

Gloves should be kept in a clean, dry place, such as a glove bag in between use, to insure the useful product life of the gloves.

Leather Protectors are designed to provide mechanical protection for the rubber gloves, protecting them against potential puncture.

Contact your supervisor or the standards for further information.

What does PRETESTED mean?

All Rubber Insulating Gloves must be tested and certified prior to use, in accordance with the ASTM F496 standard. This involves subjecting the actual gloves to voltage testing and inspection. A glove that successfully passes the testing is marked with the date of testing. Gloves that fail the testing will be marked as failure and typically discarded, or returned to the client to be discarded.

All rubber gloves sold by Oberon have been tested in batch. This typically means that the gloves are tested at the time of manufacturing, rather than at the time of sale. The ASTM F496 standard allows for up to 12 months from testing to first use by the consumer. This efficiency can mean a substantial cost savings to the consumer, with no loss of protection or quality of the gloves. More importantly, batch testing does **not** diminish the useful life of the glove. The gloves still retain their full useful life, detailed in the standard, from the date of first use, not from the test date, typically 6 months from the first time the gloves are used.

RUBBER ELECTRICAL INSULATING GLOVES - CLASS 00

- ✓ Class 00 Rubber Insulating Glove provide insulating protection up to 500VAC and 750VDC
- ✓ Each Glove is Pretested. No further testing is required as long as first use of the gloves is within 12 months of the date stamp
- ✓ Glove Kit includes pair of rubber electrical insulating gloves, pair of goat skin leather protectors (thinner for better dexterity) and canvas glove storage bag
- ✓ Rubber Gloves are manufactured of Black Rubber using an aqueous dip method for thinner glove, better feel & dexterity
- ✓ Rubber Gloves are 11" Length with Rolled Cuff
- ✓ Also available individually
- ✓ Meets ASTM D120 and ASTM F696
- ✓ Rubber Glove & Leather are imported. Glove Bag made in USA

RUBBER ELECTRICAL INSULATING GLOVES - CLASS 0

- ✓ Class 0 Rubber Insulating Glove provide insulating protection up to 1000VAC and 1500VDC
- ✓ Each Glove is Pretested. No further testing is required as long as first use of the gloves is within 12 months of the date stamp
- ✓ Glove Kit includes pair of rubber electrical insulating gloves, pair of goat skin leather protectors (thinner for better dexterity) and canvas glove storage bag
- ✓ Rubber Gloves are manufactured of Black Rubber using an aqueous dip method for thinner glove, better feel & dexterity
- ✓ Rubber Gloves are 11" Length with Rolled Cuff
- ✓ Also available individually

RUBBER ELECTRICAL INSULATING GLOVES - CLASS 1

- ✓ Class 1 Rubber Insulating Glove provide insulating protection up to 7500VAC and 11250VDC
- ✓ Each Glove is Pretested. No further testing is required as long as first use of the gloves is within 12 months of the date stamp
- ✓ Glove Kit includes pair of rubber electrical insulating gloves, pair of cowhide leather protectors (more durable) and canvas glove storage bag
- ✓ Rubber Gloves are manufactured of Black Rubber using an aqueous dip method for thinner glove, better feel & dexterity
- ✓ Rubber Gloves are 14" Length with Rolled Cuff
- ✓ Also available individually
- ✓ Meets ASTM D120 and ASTM F696
- ✓ Rubber Glove & Leather are imported. Glove Bag made in USA

PREMIUM ARC25 SERIES ARC FLASH GLOVES

- ✓ ARC25 Arc Flash Gloves extend the protection of your PPE3 Arc Flash suits to your hands when working within the hazard approach boundary
- ✓ ARC25 Arc Flash Gloves are NOT a substitution for Rubber Insulating Gloves or leather protectors.
- ✓ They **DO NOT** provide insulation from electric shock!!
- ✓ Inherently Flame Resistant fabrics mean lighter weight
- ✓ Provides improved dexterity compared to other gloves without sacrificing the protection arc flash protection
- ✓ Meets NFPA 70E, CSA Z462, ASTM F1506
- ✓ Made in USA

FAQ: Rubber Insulating Gloves

What protection do Rubber Insulating Gloves Provide?

Rubber Insulating Gloves are designed and constructed to act as a barrier between the user and the energy/voltage, to insulate the user from electric shock. The ASTM D120 standard outlines the protection that the glove provides. The rubber gloves are thicker as their protection increases. The rubber gloves will provide protection against either Alternating Current (AC) as well as Direct Current (DC), up to the levels detailed in the standard as well as typically on the labeling, which is required to be affixed to each glove. It is important NOT to exceed the USE voltage detailed to avoid injury.

Rubber Glove Class	Maximum Use Volts AC	Maximum Use Volts DC
	TASK UP TO 500 VAC	TASK UP TO 750 VDC
	TASK UP TO 1000 VAC	TASK UP TO 1500 VDC
	TASK UP TO 7500 VAC	TASK UP TO 11250 VDC
	TASK UP TO 17000 VAC	TASK UP TO 25500 VDC
	TASK UP TO 26500 VAC	TASK UP TO 39750 VDC
	TASK UP TO 36000 VAC	TASK UP TO 54000 VDC

How do I inspect my gloves?

Every pair of gloves must be inspected prior to **EVERY USE**. This inspection will evaluate the glove for any degradation or damage. A visual inspection will include looking for damage such as surface cracking, abrasions or punctures that may diminish the gloves' protection. Additionally, it is important to conduct an inflation test to determine if the glove have been punctured by prior use. This can be accomplished by grasping the glove at the cuff and spinning them, trapping some air within the gloves. Squeeze the glove and carefully listen and feel for escaping air through the glove. If you feel or hear escaping air, the gloves should not be used. Glove inflating devices are also available.

Gloves should be kept in a clean, dry place, such as a glove bag in between use, to insure the useful product life of the gloves.

Leather Protectors are designed to provide mechanical protection for the rubber gloves, protecting them against potential puncture.

Contact your supervisor or the standards for further information.

What does PRETESTED mean?

All Rubber Insulating Gloves must be tested and certified prior to use, in accordance with the ASTM F496 standard. This involves subjecting the actual gloves to voltage testing and inspection. A glove that successfully passes the testing is marked with the date of testing. Gloves that fail the testing will be marked as failure and typically discarded, or returned to the client to be discarded.

All rubber gloves sold by Oberon have been tested in batch. This typically means that the gloves are tested at the time of manufacturing, rather than at the time of sale. The ASTM F496 standard allows for up to 12 months from testing to first use by the consumer. This efficiency can mean a substantial cost savings to the consumer, with no loss of protection or quality of the gloves. More importantly, batch testing does **not** diminish the useful life of the glove. The gloves still retain their full useful life, detailed in the standard, from the date of first use, not from the test date, typically 6 months from the first time the gloves are used.

PERSONAL LOTO ELECTRICAL KIT

12 pc

- ✓ Pouch that can be worn on your belt
- ✓ 4" tall x 6" wide x 2" deep
- ✓ Zippered Top
- ✓ Color: Bright Red
- ✓ Made in USA
